Article Example: *Online Psychology Degrees for Mental Health Careers in 2026*

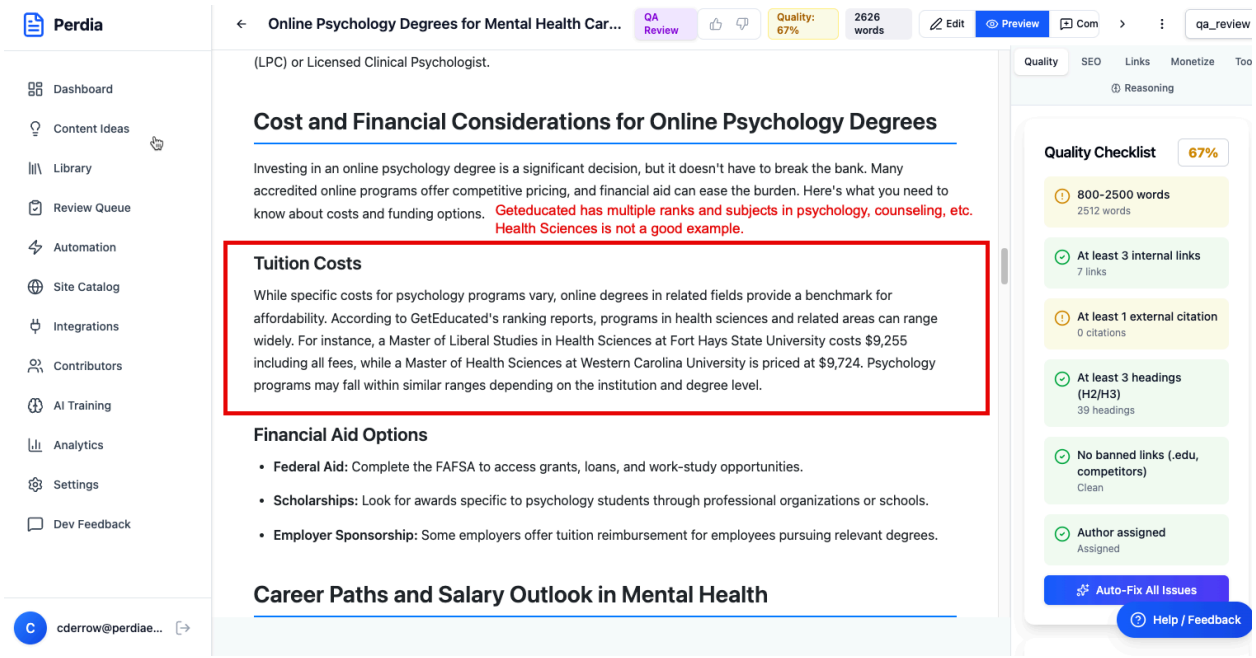
Summary:

After a single failed prompt, I had to break update requests into individual comments, revising after each comment. This is the only way that AI Revise could properly manage tasks. It took more than an hour and this section is still factually incorrect. The comment section is inefficient and often outputs inaccurate information.

Step One

This section requires editing:

- Health Sciences is not a related field to Psychology, and GetEducated has an entire Category related to Psychology & Human Services, with a specific Psychology subject area.
- The specific degrees cited are not client-specific.



I highlighted the entire paragraph, and added the following prompt to comments:

This example is not relevant. The examples provided need to be directly relevant to the topic. Complete these three actions:

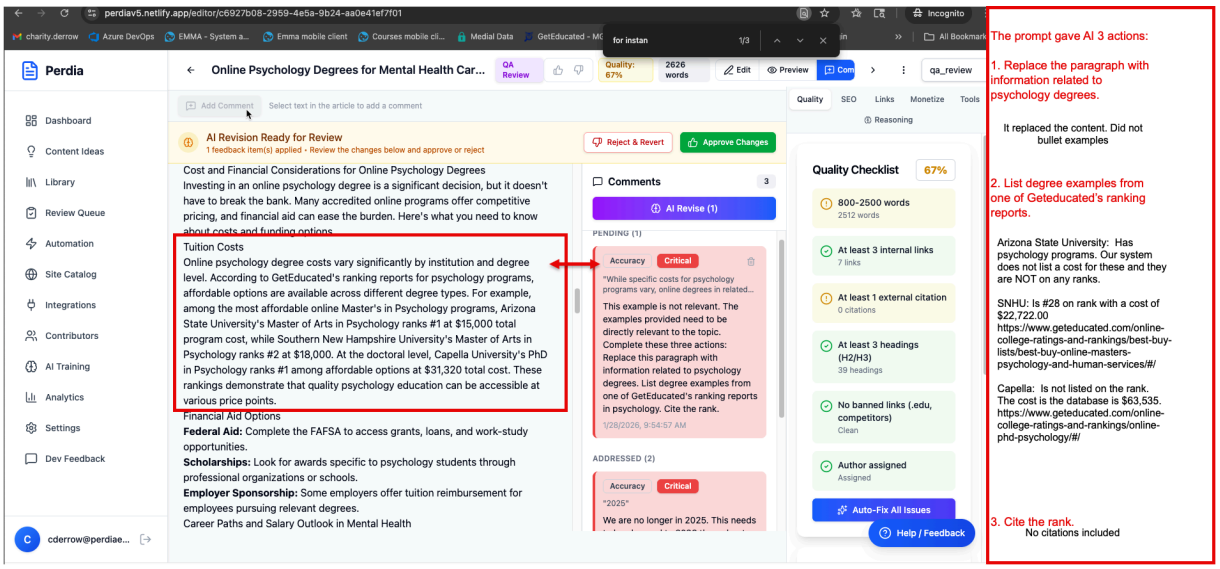
- *Replace the paragraph with information related to psychology degrees.*
- *List degree examples from one of GetEducated's ranking reports in psychology.*

- *Cite the rank.*

Results:

- It correctly updated the content to psychology
- It provided three degree examples, which are clients, but none of the data is factual. Only SNHU is on the psychology rank. The tuition costs are incorrect. The placement on the rank for SNHU is incorrect.
- The results were not in a bulleted list
- The rank was not cited. I'm unsure where AI pulled this data from.

I clicked to Reject and Revert.



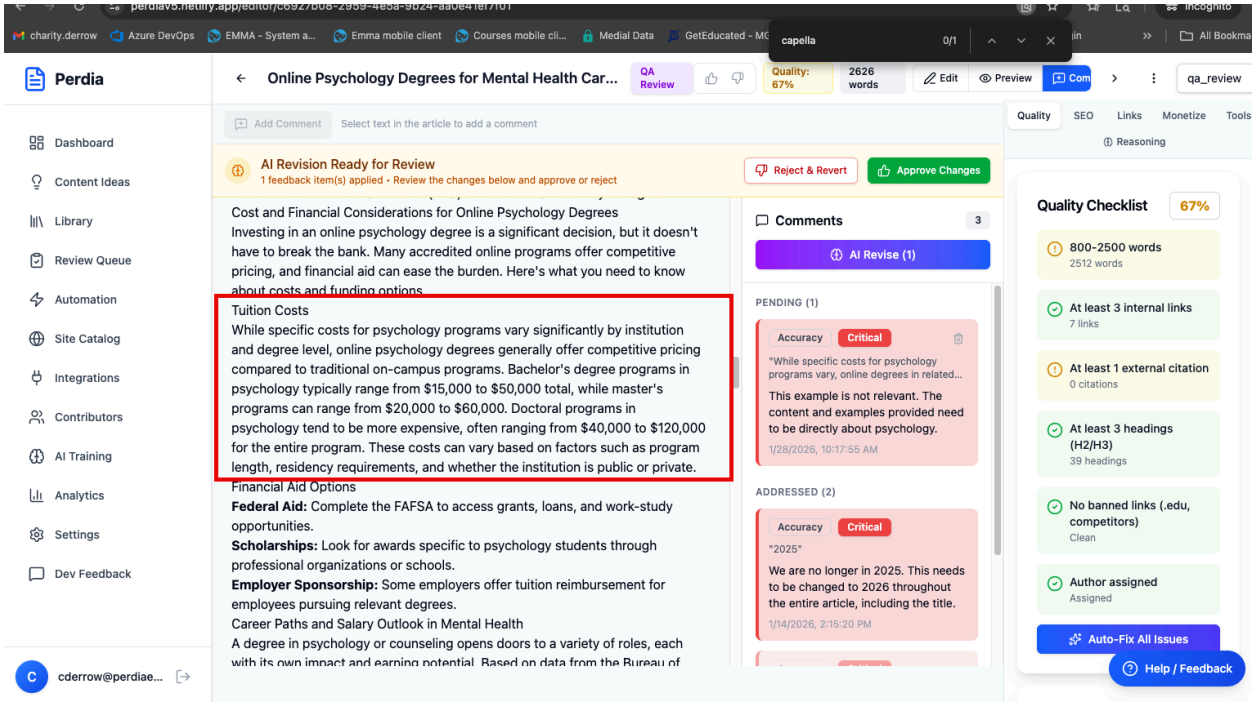
Step Two:

I broke it down and prompted in individual steps. I ran AI Revise after each comment.

First, I highlighted the entire paragraph and prompted it to: *This example is not relevant. The content and examples provided need to be directly about psychology.*

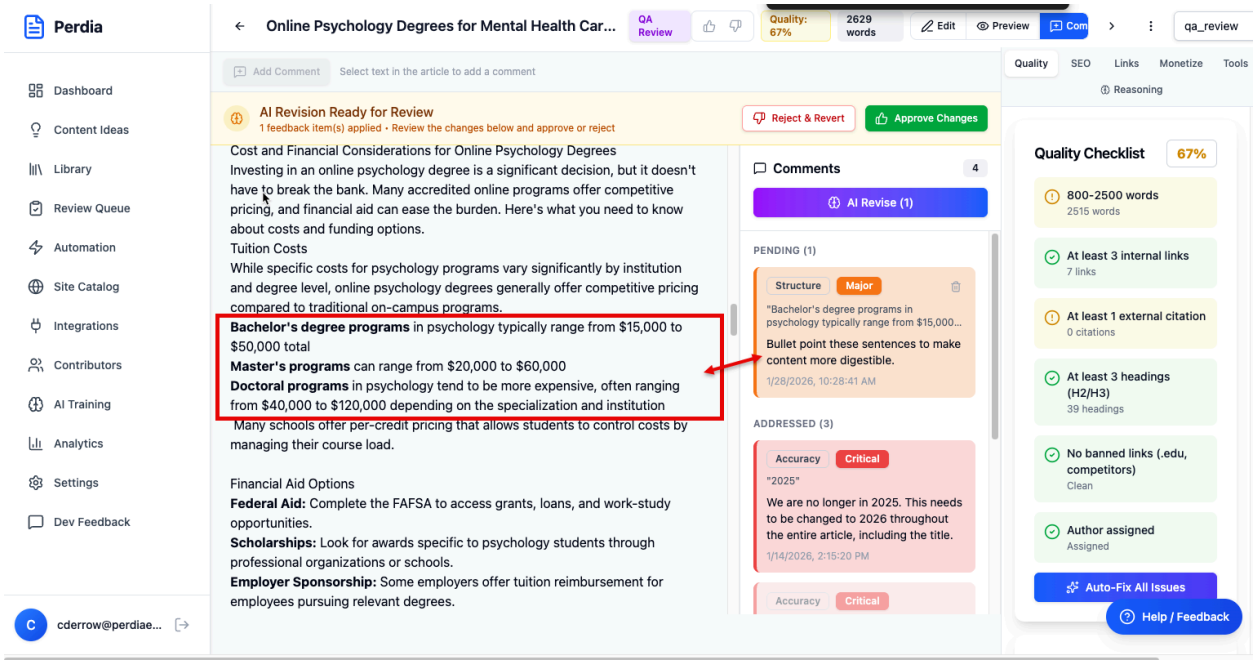
Results:

- Costs include a range and address the types of degree program costs. It did not cite data and didn't provide specific degrees. That said, I did not specify that in the prompt. I clicked to Approve changes.

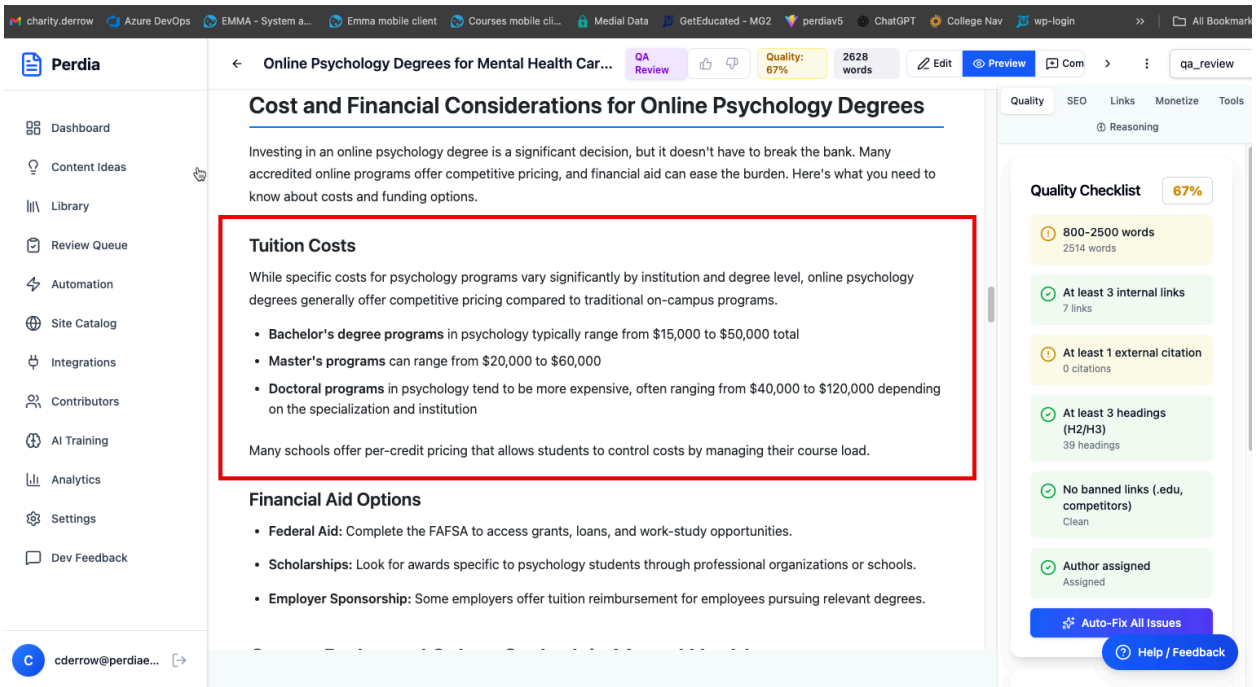


Second: I prompted AI to: *Bullet point these sentences to make content more digestible.*

- AI revised the highlighted sentences into bulleted statements
- I clicked to Approve Changes



In preview mode:



Step Three:

On the surface, it looks good, but it's factually incorrect, and there are no cites as to where this data came from.

I need to add a comment for each type of degree, and have AI:

- Update the costs to make them factually align with their respective ranks
- Include an internal link to the rank page.

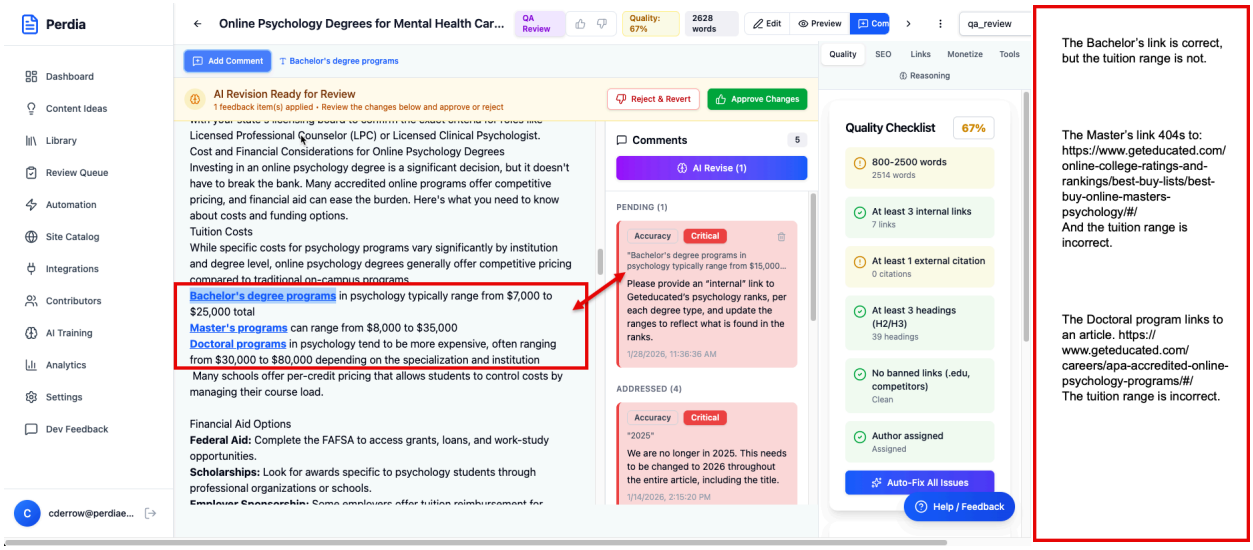
I highlight the entire section, with the following prompt:

Please provide an "internal" link to Geteducated's psychology ranks, per each degree type, and update the ranges to reflect what is found in the ranks.

Results:

- The bachelor's link is correct, tuition range is not
- The master's link 404s, the tuition range is incorrect
- The doctor's link directs you to an article (okay, but not accurate), and the tuition range is incorrect.

I rejected and reverted changes.



I have attached a video that shows where the links go.
